

# Drilling Consumables Information Sheet

You want your drilling to be fast, efficient, clean and safe...

PR Polymers manufactures a range of drilling consumables designed to make sure that this is the case.

PR Polymers Deflector Sheets are specifically designed to ensure your cuttings are deflected well away from the hole, reducing wasteful and costly re-drilling from fallback.

Your priority is bailing cuttings out of the hole as efficiently as possible. Our expertise ensures that this happens.

Our Deflector Sheets have been engineered with high rebound qualities.

This means cuttings are distributed away from the hole, leaving you with larger particle size in your pile, not a mound of dust that keeps refilling your hole.

## As a result:

- Your cuttings pile can be used as stemming
- Better particle size distribution will reduce the height of your cuttings pile
- Larger particle size and less regrind will cut down airborne respirable dust
- Reduce your dependence on water

Deflector Sheets are available in sizes to suit all drills and rod sizes. Don't drill the same hole twice.
